Dimensional relationship diagram

The dimensional relationship between the screen and the projector is shown below.

**NOTE**

- The indications of this illustration are premised on aligning the projected image size and position to the full screen.

### Notes:

- The illustrations of projectors in this manual are for informational purposes only and do not represent a specific projector model. Configurations may vary with the model.
- As the front end of the lens approaches closer to a spherical or column-shaped screen center, uniformity of the total focus and total brightness of the projected image is enhanced.
- The angle of view values indicated in the tables are lens optical axis angles.
## Lens shift ranges

Lens shift function allows to shift the position of a projected image as shown below.

**NOTE**

- The lens shift ranges that are shown indicate the positional relationships between the projector’s display panel (DLP chip) and lens.
- The screen position of the image projected on the screen does not move in proportion to the screen size.
- For details on the relationship between the lens shift and the projected angle of view, see “Projection relationships (P2)”
